Khmer Digital Bookstore · <https://khozyreads.com>

WEBSITE & PORTAL PROCESSING FLOW

Prepared for ABA PayWay merchant onboarding · October 2026

1. About the business

KhozyReads is an online digital bookstore for Khmer novels and stories. Readers create an account, buy a book, and read it instantly on the website — there is no physical delivery. The platform is built for Cambodian readers at home and abroad, with a Khmer-first interface (English available) and one-tap sign-in with Telegram or Google.

- Website (customer-facing): <https://khozyreads.com>
- Admin portal (merchant-only): <https://khozyreads.com/admin.html>
- Products: digital books (PDF-based, read inside a protected online reader with watermarking).
- Pricing: per book, in USD or KHR, set by the merchant in the admin portal.
- Payment method requested: ABA PayWay eCommerce Checkout — KHQR (ABA PAY and other KHQR member banks).

2. Customer purchase flow

Step	What happens
1. Browse	The customer opens khozyreads.com and browses the catalogue. Each book shows its cover, title, author, synopsis, genre and price with currency.
2. Sign in	The customer signs in (or registers) with one tap using Telegram or Google. No password is required.
3. Buy Now	On the book page the customer taps “Buy Now”. The system creates an order with status “pending” and opens the payment page, which shows the book title, amount, currency and (optionally) a promo-code field.
4. Pay with KHQR	The customer taps “Pay with KHQR”. KhozyReads’ server creates the transaction with the PayWay Purchase API and shows the resulting KHQR code in a secure pop-up on the website. On a phone, an “Open ABA Mobile” button is also shown. The customer scans/pays with ABA Mobile or any KHQR-supported banking app. The QR is valid for 30 minutes.
5. Auto-verify	As soon as the payment is made, PayWay notifies KhozyReads (return URL callback). The website also checks the status automatically every few seconds. The server confirms the result with the PayWay Check Transaction API before approving.
6. Read	The order becomes “approved”, the book is unlocked in the customer’s “My Library”, a

Step	What happens
instantly	confirmation is shown on screen, and a Telegram notification is sent to the customer. The customer can start reading immediately.

3. Payment processing (technical)

Step	What happens
Create order	Order record stored (order ID, buyer, book, amount, currency, status = pending).
Purchase API	Server-side call to PayWay POST /api/payment-gateway/v1/payments/purchase with payment_option = abapay_khqr. The request is signed with HMAC-SHA512 using the merchant API key; credentials are never exposed to the browser.
Show KHQR	PayWay returns the KHQR payload (QR image + deeplink). It is displayed to the customer together with the amount and a countdown.
Callback + polling	PayWay posts the payment result to the merchant return URL. In parallel, the website polls the merchant server for the status so the page updates even if the customer closed the QR pop-up.
Check Transaction	Before granting access, the merchant server always re-verifies the transaction with PayWay's Check Transaction API. Only a PayWay status of APPROVED unlocks the content.
Approve + notify	Order marked approved with the PayWay transaction ID and APV code; library access granted; audit log written; receipt shown; Telegram notifications sent to the customer and the merchant.

Security & data handling

- Merchant ID and API key are stored only as server-side secrets (never in the website code).
- Every approval is based on PayWay's own status (Check Transaction), not on data sent by the customer's browser.
- Approval is idempotent — duplicate callbacks cannot create duplicate access.
- Each PayWay transaction ID is mapped to exactly one order; all payments are traceable in the admin portal.
- Customers must acknowledge the Cancellation & Refund Policy before paying (digital goods, non-refundable).

4. Merchant portal (admin dashboard)

The admin portal is accessible only to the merchant account. It is used to manage the catalogue and to monitor payments:

- Books — add/edit books, upload the PDF and cover, set price and currency, enable/disable sales, mark “coming soon”.
- Orders — list of all orders with status (pending / approved / rejected), buyer, book, amount, date and payment method.

- Payment records — for every approved PayWay payment the transaction ID and APV code are stored and visible.
- Settings — store name, payment notices (Khmer/English), Telegram notification settings.
- Users & logs — buyer accounts, library access, and a full audit trail of all actions (orders, approvals, reads).

5. Customer support & refunds

Customers can reach the merchant directly from the website via Telegram, phone or email (shown on the payment page and in the footer). All sales are digital and final; exceptional cases (duplicate charge, content not delivered) are handled according to the Cancellation & Refund Policy submitted with this document.
